10. Based on the figure below, what does the early stopping point indicate?

Figure 5. Screen shot of early stopping

The validation data set does not have enough samples to generate an accurate estimation of the modeling results

The learner is about to reach the overfit point and is no longer able to be generalized to new data

Training and validation sets have an equal number of iterations and the model should not be stopped until after this point

Training the data to the point just before the training data error matches the validation data error
